

$$A = \{1, 2, 3\}, (P(A), \subseteq)$$

Hasse Diagram:

→ Is this a lattice?

NO: why?

a and b have
 x & y as upper bound
but not least upper
bound

$$a \wedge b = b \wedge a \quad a \vee b = b \vee a$$

Is this before?

$$b \vee c = y$$

$$a \wedge c = x$$

$$b \wedge a = (?)$$

\downarrow
 x

$$a \vee b = y$$

$$a \wedge b =$$

$$a \wedge b = x$$

$$x \subseteq b, \quad x \subseteq a$$

find $a \vee b$?

$$\text{lub}(a, b) = \underline{\underline{a \vee b}}$$

(read as a or b

otherwise

a join b .

otherwise

a union b

$$\underline{\underline{\text{glb}(a, b)}} = \underline{\underline{a \wedge b}}$$

↓

read as

a and b

a meet b

\Leftarrow a intersection b
